

Each portion of the slit acts as a point source of light waves.

The path difference between rays 1 and 3, rays 2 and 4, or rays 3 and 5 is  $(a/2) \sin \theta$ .

**Figure 38.5** Paths of light rays that encounter a narrow slit of width  $a$  and diffract toward a screen in the direction described by angle  $\theta$  (not to scale).

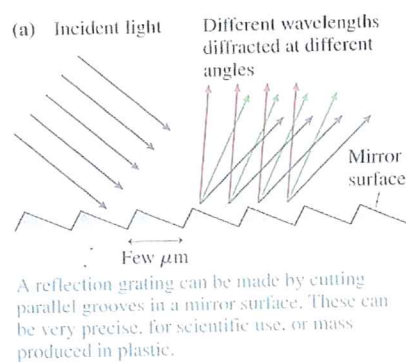

**Figure 38.2** Light from a small source passes by the edge of an opaque object and continues on to a screen. A diffraction pattern consisting of bright and dark fringes appears on the screen in the region above the edge of the object.

**Figure 38.3** Diffraction pattern created by the illumination of a penny, with the penny positioned midway between the screen and light source.

**FIGURE 22.9** Reflection gratings.

When we assume  $r_1$  is parallel to  $r_2$ , the path difference between the two rays is  $r_2 - r_1 = d \sin \theta$ .

**Figure 37.5** (a) Geometric construction for describing Young's double-slit experiment (not to scale). (b) The slits are represented as sources, and the outgoing light rays are assumed to be parallel as they travel to  $P$ . To achieve that in practice, it is essential that  $L \gg d$ .

(b)

(a)

**FIGURE 22.1** Water waves spread out behind a small hole in a barrier, but light passing through a doorway makes a sharp-edged shadow.

When  $\lambda \ll d$ , the rays continue in a straight-line path and the ray approximation remains valid.

$\lambda \ll d$

When  $\lambda \approx d$ , the rays spread out after passing through the opening.

$\lambda \approx d$

When  $\lambda \gg d$ , the opening behaves as a point source emitting spherical waves.

#### ACTIVE FIGURE 35.4

A plane wave of wavelength  $\lambda$  is incident on a barrier in which there is an opening of diameter  $d$ .

# ★ Thin film Interference (35.4) // different approach ★

Recall: Interference of waves

$$\Delta L = 0, \lambda, 2\lambda, 3\lambda, \dots$$

↑  
Shown

CONSTRUCTIVE INTERFERENCE

These are NOT notes. They are a visual aid(20%) for a verbal explanation(80%).

2

NOTE: When waves reflect from  
— an interface, it is possible  
That the phase changes.

INVERTED when  $n_2 > n_1$   
(phase change)  
"hits a 'hard' surface"

These are NOT notes. They are a visual aid (20%) for a verbal explanation (80%).

3

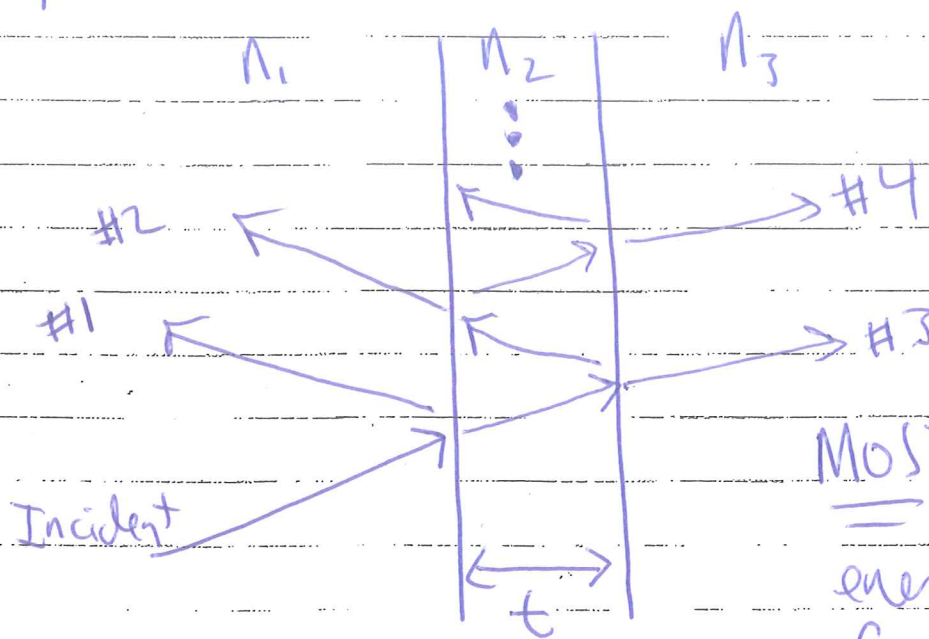

Thin films: Always assume normal incidence.

Confusing!!

SOAP film (demo 😊)

Simple Picture:

MOST of the energy is in these four waves.

Reflection: (#1, #2)

Interference  $\Delta L = 2t$

IGNORE THE REST

Compare to wavelength

BUT : Must compare to the wavelength  
in the medium where  
DL occurs.

$n_1$	$n_2$
$\lambda_1 f = v_1$	$\lambda_2 f = v_2$

Note: Unless otherwise specified, wavelengths  
give or asked for, are VACUUM \*  
wavelengths ( $n_1 = 1, v_1 = c$ ).

Short cut:  $\lambda_{\text{film}} = \frac{\lambda_0}{n}$  ← \*

EX.] A Soap film ( $n = 1.33$ ) strongly reflects  
red light ( $\lambda = 600\text{nm}$ ). What are  
the smallest three possible thicknesses  
for the film?

$$\lambda_{\text{film}} = \frac{600}{1.33} = 451\text{nm}$$

- "reflection"  $\Rightarrow$  look @ #1, #2
- "strongly"  $\Rightarrow$  CONSTRUCTIVE

- Phase changes? 1 phase change

$$\therefore \Delta L = \frac{\lambda_{\text{film}}}{2}, \frac{3\lambda_{\text{film}}}{2}, \frac{5\lambda_{\text{film}}}{2}, \dots$$

$$\Delta L = 2t_1 = \frac{\lambda_{\text{film}}}{2}$$

$$\therefore t_1 = \frac{\lambda_{\text{film}}}{4} = \frac{451\text{nm}}{4} = 112.8\text{ nm}$$

(OR)

$$\Delta L = 2t_2 = \frac{3\lambda_{\text{film}}}{2}$$

$$\therefore t_2 = 338.4\text{ nm}$$

(OR)

$$\Delta L = 2t_3 = \frac{5\lambda_{\text{film}}}{2}$$

$$\therefore t_3 = 564\text{ nm}$$

⋮

Hmmm... A maximum in reflection corresponds to a minimum in transmission. We could have looked @ #3 and #4!!

- Destructive in #3, #4
- Phase changes? NO PHASE CHANGES

$$\Delta L = 2t = \frac{\lambda_{\text{film}}}{2}, \frac{3\lambda_{\text{film}}}{2}, \dots$$

EX.) A thin film ( $n=1.4$ ) on a glass surface ( $n=1.5$ )

\* Phase change

$$\lambda_{\text{film}} = \frac{\lambda_A}{1.4}$$

Condition for a maximum reflection for wavelength  $\lambda_A$ ?

2 phase changes  $\Delta L = 0, \lambda_{\text{film}}, 2\lambda_{\text{film}}, \dots$

Condition for a maximum transmission for wavelength  $\lambda_A$ ?

1 phase change  $\Delta L = \frac{\lambda_{\text{film}}}{2}, \frac{3\lambda_{\text{film}}}{2}, \dots$
